

Lithium

A comeback or a false start?

Equities Metals & Mining

Global

- ◆ Lithium prices are on the rise again, and this time it is demand-driven
- ◆ We still forecast a surplus market in 2026 as supply matches demand growth, but risks are skewed to the upside
- ◆ Maintain Buy rating on SQM, Hold on ALB, LAC, and LAR; revise target prices

Lithium prices inching up again: Lithium carbonate (BG China) prices are up c55% from the June trough. Spodumene (FOB) prices are up c83%, also from a trough. Unlike the August rally, which was supported by potential supply disruptions, this time the rally is driven by strong demand from ESS and inventory de-stocking. Lithium chemical inventories as well as cathode inventories in China have fallen for the past few months. While strong demand is the main driver, the possibility of supply disruptions is also buoying sentiment, in our view. CATL's mine which stopped production in August is yet to restart. Ongoing unrest in Mali hasn't had an impact on lithium production yet, but the risk of disruption is increasing.

Lesser but still in a surplus: Encouraged by an uptick in demand from ESS and strong EV volumes in China, we increase our demand estimates. Though we have reduced our surplus forecast, we still expect the lithium market to be in a surplus over the next few years based on our base case assumption of a c298kt increase in supply (including recycling) and c307kt increase in demand. That said, we highlight heightened risks of supply disruptions and higher-than-expected demand which could result in a balanced market. Our 2026 demand estimate is based on c2,150GWh battery production for EV and ESS. We estimate that a 10% impact (either through higher demand or increased supply disruptions) could turn the market into a small deficit (see scenario analysis, pg. 6).

Maintain Buy rating on SQM, Hold on ALB, LAC, and LAR: We prefer SQM due to its operational excellence, strong balance sheet, and potential volume growth. The stock prices of the companies have increased 70-135% from the start of 2H25 on the back of a recovery in lithium prices. In our scenario analysis, if lithium prices average 20% higher than our base case, we estimate the NAV/share for the companies under our coverage to increase 21-66%, with **LAR and ALB** showing the greatest increase (see sensitivity analysis in the respective company sections).

Lithium prices rallying again after a prolonged slump

Lithium carbonate (BG China) prices are up c55% from the June trough. Spodumene (FOB) prices are up c83%, also from trough levels. However, the trajectory has not been linear. Prices rallied in August on the back of expectations of supply disruptions in China. But the momentum faded as the supply issues dissipated.

Lithium prices are inching up again, this time driven by a surge in demand from ESS and destocking of chemical inventories in China. Lithium inventories in China have fallen for the past couple of months. At the same time, cathode inventories are also falling, highlighting a strong demand environment. While the current inventory of c120kt (or c3.9 weeks of global consumption) is close to normalized levels, the declining trend is encouraging.

While demand recovery in China remains the key driver, other factors are also supporting the price rally. Though CATL's mine reserve reports have been approved by authorities and the mine is expected to restart in 4Q25, the longer-than-expected delay in the restart is causing market tightness. There is also a risk of potential supply disruption from the ongoing unrest in Mali. The Goulamina and Bougouni lithium projects have started this year, and we forecast they will produce c80kt LCE in 2026e. While there has been no impact on production from these operations so far, the possibility of future disruption is increasing, in our view.

Lithium prices inching up again

Source: Bloomberg, HSBC

Digging deep into demand

Renewed optimism around demand-led recovery started with CATL's 30% upward revision to 2026 production guidance to 1,300GWh in September. This was on the back of a surge in demand across the energy storage system (ESS) and EV segments.

China's ESS battery sales in 9M25 reached 211GWh (+66% y-o-y) domestically and 71GWh (+110% y-o-y) overseas, fuelled by domestic ESS policy reforms and subsidies, as well as export demand from Europe, the Middle East, and Australia. The removal of the mandatory ESS installation policy in June did not negatively impact demand. Instead, improved spot power market mechanisms and local standalone ESS support policies (like capacity subsidies) have boosted project returns, making demand more market-driven.

In the EV space, domestic commercial vehicle battery installations increased 136% y-o-y to 92GWh, driven by rising EV adoption in commercial vehicles because of policy support

We forecast lithium demand (in LCE terms) grows 19% (or c307kt LCE) in 2026

(purchase tax exemption and trade-in subsidies) and cost parity with ICE vehicles. Domestic passenger EV battery installation is on track (up 31% y-o-y to 402GWh), with BEV sales outpacing PHEV in 9M25 (32% vs 13% y-o-y growth).

HSBC analysts believe that battery makers' utilisation rate is rising, and new capacity expansion is underway. After two years of disciplined capacity growth, the battery sector is entering a new expansion phase (see [China EV and ESS battery](#), 11 November 2025).

As a result, we have revised our lithium demand y-o-y growth forecast for 2025 to 28% (from 27%) and for 2026 to 19% (from 18%). Our forecasts imply incremental demand of 307kt LCE in 2026. Of total incremental demand, EV accounts for c208kt and ESS for c62kt. For our demand calculation, we bake in battery demand of c2,150GWh from EV + ESS battery production for 2026.

That said, if the current momentum in ESS installations continues throughout 2026, it will result in higher lithium demand. On the other hand, there is a policy shift in China – the scheduled phase-out of EV subsidies by end-2025 and the halving of EV purchase tax exemptions starting from 2026 (vs full exemption in 2025). The change in EV subsidies might be leading to front-loading of demand in 4Q25, with a potential slowdown in 2026.

HSBC's China auto analysts have raised 2025 China passenger car demand growth forecasts to 6% from 0%, factoring in the positive impact of government subsidies. However, the team expects a demand pull-forward into 2025 at year-end, driven by the expected subsidy phase-out, and have lowered the 2026 demand growth forecast to -3% from -1%. For EVs, the team sees y-o-y volume growth of 15% in 2026e vs 20% in 2025e (see [China EV Tracker: Peak-season momentum expected to regain strength](#), 19 November 2025).

2026 lithium demand: EV + ESS key driver (in kt)

Source: HSBC estimates

Digging deep into supply increases

We expect refined supply (ex-recycling) to grow 16% y-o-y (or c278kt LCE) in 2026

While focus has shifted to demand, we cannot ignore supply-side issues and expected growth in production. We forecast refined supply (ex-recycling) to grow 35% y-o-y in 2025 and 16% in 2026. The start/ramp-up of the key projects across the globe is driving the y-o-y increase (of c278kt) in 2026.

The following 14 operations will contribute more than 200kt of the incremental production in 2026 – Goulamina, Da Hongliutan, Greenbushes, Xiangyuan, Mamico (Zangge), Kathleen Valley, SQM's Atacama, Sabi Star, Grota do Cirilo, Centenario-Ratones, Bougouni, Salar Del Hombre Muerto, Tres Quebradas, and Lionheart.

Majority of the incremental supply in 2026 is being added in China, Argentina, Mali, and Zimbabwe (before recycling supply, in kt)

Source: HSBC estimates

In 2H25, licensing issues threatened to constrain lithium mine production in China's Jiangxi and Qinghai provinces. CATL announced its plan to restart soon after shutting down the operation in August, though it has yet to actually restart. The ongoing unrest in Mali hasn't impacted the ramp-up of the Goulamina and Bougouni operations yet, though it poses risk. We acknowledge disruptions at existing operations, and delay or slower ramp-ups at new projects pose downside risk to our supply growth assumptions.

HSBC base case – still a surplus market in 2026

Based on upward revision in our demand estimates driven by stronger demand from ESS, our market balance forecasts have reduced over the forecast period. That said, we still forecast the lithium market to be in a surplus in 2026 based on our base case assumption of a c298kt increase in supply (including recycling) and c307kt increase in demand.

Source: HSBC estimates. Note: *in 2025 USD terms

What would turn the market into a deficit?

We have highlighted risks to demand and supply for the next year. There has been optimism around demand growth next year – CATL's 1,300GWh production guidance and Ganfeng's 30-40% demand growth expectation for 2026. Our forecasts are below these but still show a strong 19% y-o-y growth. On the supply side, any delay in the ramp-up of key projects, licensing issues and production impact due to any other reasons could lead to lower-than-expected supply.

We analysed the impact of lower supply and changes in demand on our 2026 surplus forecast. Given increasing risk of supply disruptions, we include the scenarios below, considering 5% and 10% reduction in refined supply (excluding recycling). The 5% reduction implies a cut of c100kt of supply and a 10% reduction implies reduction of c200kt.

On the demand side, we view battery production for EV and ESS as the key driver, and the factor which will vary most. In our model, we assume 2,150GWh of energy requirement, which drives our lithium demand view. For the analysis, we assume scenarios with higher and lower energy requirements from EV and ESS, and no changes in demand from the other industries.

Based on our analysis, battery production above 2,350GWh for EV+ESS, or supply disruptions impacting c7.5% of total supply, will result in a small deficit in 2026.

2026 surplus / (deficit) under various scenarios

in kt	Base case supply	5% reduction in base case supply	10% reduction in base case supply
10% reduction in demand from EV+ESS	314	214	114
5% reduction in demand from EV+ESS	229	129	29
Base case demand	143	43	-57
5% increase in demand from EV+ESS	58	-42	-142
10% increase in demand from EV+ESS	-27	-127	-227

Source: HSBC estimates

SQM (SQM US, CMP USD59.54) - Maintain Buy; increase TP to USD71.00 from USD48.00

Investment thesis

We like SQM, expecting an increase in volumes, strong balance sheet, and quality assets. The ramp-up at Kwinana refinery in Australia and increased volumes in Chile will drive volume growth, in our view. The agreement with Codelco removes a key overhang. The company's realised prices follow spot-price movement closely. With SQM's relatively lower cost of production, the company should continue to generate decent cash flow.

Sensitivity to changes in lithium prices

Lithium prices are volatile, and the stock prices show a high degree of sensitivity to changes in lithium prices. The company's realised prices follow the spot-price movement closely. We ran scenarios to analyse the impact of change in our lithium price assumptions of the forecast period (including long-term prices).

SQM: Sensitivity to changes in lithium price assumptions

	2026e EBITDA USDm	2027e EBITDA USDm	NAV/shr USD	Change vs base case (%)		
				2026e EBITDA	2027e EBITDA	NAV/shr
20% lower prices	1,361	1,563	55.00	-22%	-22%	-23%
10% lower prices	1,559	1,786	63.00	-11%	-10%	-11%
Base case	1,755	1,995	71.00			
10% higher prices	1,923	2,183	78.00	10%	9%	10%
20% higher prices	2,090	2,371	86.00	19%	19%	21%

Source: HSBC estimates

Change in estimates

Our model incorporates 3Q25 results and changes in our lithium price forecasts. The increase in 2025-26 estimates is primarily driven by strong 3Q25 results and increase in our lithium price forecasts. The company has also guided capex to be lower during the 2025-27 period.

Valuation and risks

We value SQM using a sum-of-the-parts approach (see table below), assuming a WACC of 7.8% (from 7.9% due to lower cost of debt from 5.0% to 4.5%), based on a risk-free rate of 4.25%, country risk premium of 1.2%, equity risk premium of 4.00%, levered beta of 1.1, and

debt/equity of 30/70. We value the Chilean lithium, international lithium, and other businesses using NPV. We increase our TP to USD71.00 (from USD48.00) based on upward revision in our estimates and lower WACC. Our revised TP implies 19.2% upside, and we maintain our Buy rating on expectations of a re-rating post finalisation of the agreement with Codelco and expected volume growth.

Our TP for the local shares (SQM/B CI, CMP CLP56,100) of CLP66,360 (previously CLP45,700) is based on one share per ADR and a spot USD-CLP FX of 935 (from 952).

Sum-of-the-parts approach (USDm)

	USDm
Lithium Chile division	9,886
International Lithium division	2,750
Other businesses	13,172
Corporate	(2,113)
EV	23,695
Net debt	3,338
Less: non-controlling stake	41
Equity value	22,316
No. of shares	286
Fair value/share (USD)	71.00

Source: HSBC estimates

Downside risks include extended downcycle affecting cash flows and dividends; ramp-up issues in the Covalent lithium refinery project in Australia; material weakness in its other segments; potential policy changes that might change the lithium-producing landscape in Chile; and changes in the proposed agreement with Codelco or delay in finalisation of the agreement.

Albemarle (ALB US, CMP USD116.82) - Maintain Hold; increase TP to USD117.00 from USD87.00

Investment thesis

The company's measures to cut capex, raise capital, sell non-core businesses, and foster efficiency are resulting in improvement in FCF generation and the balance sheet. Albemarle benefits from contracted volumes as floor prices for these contracts are above spot lithium, but uncertainty around prices when these contracts are due for rollover in the next 18-24 months poses risk.

Sensitivity to changes in lithium prices

Lithium prices are volatile, and the stock price show a high degree of sensitivity to change in lithium prices. c50% of the company's volumes are on contracted basis, with the floor for these contracts above the current spot prices. However, it is the long-term outlook on prices which drives volatility in the stock price. We ran scenarios to analyse the impact of change in our lithium price assumptions of the forecast period (including long-term prices).

ALB: Sensitivity to changes in lithium price assumptions

	2026e EBITDA	2027e EBITDA	NAV/shr	Change vs base case (%)

Source: Bloomberg consensus, HSBC estimates

Valuation and risks

We value Albemarle using a DCF methodology, assuming a WACC of 8.0% based on a risk-free rate of 4.25%, equity risk premium of 4.00%, country risk premium of 0.5%, levered beta of

1.25, and debt/equity ratio of 30/70 (all unchanged). Our target price increase to USD117.00 (from USD87.00) is a function of higher estimates. Our new TP implies 0.2% upside. We reiterate our Hold rating given the potential volatility in lithium prices that skews the risk-reward to upside.

Downside risks include delays or unforeseen expenses related to capacity expansion; unexpected production cuts due to inventory pileups and weak demand and pricing; and weakness in other segments.

Upside risks include better-than expected lithium prices and EV demand growth; lower-than expected costs; and faster-than expected ramp-up of growth projects.

Lithium Americas (LAC US, CMP USD4.72) - Maintain Hold; increase TP to USD4.70 from USD3.00

Investment thesis

The company has secured financing for the Thacker Pass project, mitigating liquidity risk. That said, we believe the company is still far from its first production and highlight risks arising in case of capex overruns/delays in start of the project.

Sensitivity to changes in lithium prices and WACC

Lithium prices are volatile, and the stock price show a high degree of sensitivity to changes in lithium prices. We run scenarios to analyse the impact of changes in our lithium price assumptions of the forecast period (including long-term prices) and WACC.

LAC: Sensitivity of NAV/shr to changes in lithium prices and WACC assumptions

Change in lithium price assumptions	WACC assumptions				
	7.8%	8.3%	8.8%	9.3%	9.8%
20% lower prices	3.35	2.75	2.25	1.85	1.50
10% lower prices	4.85	4.10	3.45	2.95	2.50
Base case	6.40	5.45	4.70	4.05	3.50
10% higher prices	7.90	6.80	5.90	5.15	4.50
20% higher prices	9.40	8.15	7.10	6.25	5.50

Source: HSBC estimates

Change in estimates

We incorporate changes in our lithium price forecasts in our model as well as the recent announcements related to the first draw of the DOE loan, issuance of shares at the market price, and conversion of convertible debt.

Lithium Americas: Our estimate changes, 2025-27e

Source: HSBC estimates

Valuation and risks

We value Lithium Americas using an NPV-based approach. We use an average WACC of 8.8% (previously 9.0% due to increase the target debt/equity ratio from 15% to 35%). Our underlying cost of capital assumptions include a risk-free rate of 4.25%, equity risk premium of 4.00%, and unleveraged beta of 1.25. We increase our TP to USD4.70 (previously USD3.00) on lower WACC and cash inflow from the recent issuances. Our new TP implies 0.4% downside. We maintain our Hold rating due to reduced uncertainty with financing secured for the Thacker Pass project.

Downside risks include execution risk that would delay or result in lower-than-expected production and/or cost overruns; lower than-expected prices affecting economics adversely; and macro slowdown resulting in reduced EV sales that could lower demand for lithium.

Upside risks include faster-than-expected execution; better-than expected pricing; and higher-than-expected lithium price.

Lithium Argentina (LAR US, CMP USD4.89) - Maintain Hold; increase TP to USD4.75 from USD4.10

Investment thesis

3Q25 results demonstrated operational stability at Cauchari-Olaroz. The company brought cost down to USD6,200/t in 3Q25, and we expect further improvements in the coming quarters. The company recently announced scoping study results for the Pozuelos-Pastos Grandes (PPG) project. With the scoping study done, the PPG project is coming closer to reality, but we highlight the financing and execution risks.

Sensitivity to changes in lithium prices and WACC

Lithium prices are volatile, and the stock price shows a high degree of sensitivity to change in lithium prices. We run scenarios to analysis the impact of changes in our lithium price assumptions of the forecast period (including long-term prices) and WACC.

LAR: Sensitivity of NAV/shr to changes in lithium prices and WACC assumptions

Change in lithium price assumptions	WACC assumptions				
	10.5%	11.0%	11.5%	12.0%	12.5%
20% lower prices	2.30	1.95	1.60	1.30	1.05
10% lower prices	4.15	3.65	3.20	2.80	2.45
Base case	5.95	5.30	4.75	4.25	3.85

Source: HSBC estimates

Valuation and risks

We use an NPV-based valuation approach with a WACC of 11.5% (from 11.9% due to change in country risk premium from 4.0% to 3.5% because of change in Argentina CDS from 8% to 7%). Our underlying cost of capital assumptions include a risk-free rate of 4.25% and equity risk premium of 4.00% (in line with HSBC equity strategists), and unleveraged beta of 1.2. We also apply an additional premium of 50bp to highlight potential recapitalisation risks. We include the PPG project in our valuation but assign a 75% probability. As a result, we increase our target price to USD4.75 (from USD4.10). Our new TP implies 2.9% downside. We reiterate our Hold rating given the potential volatility in lithium prices that skews risk-reward to the upside.

Downside risks include production issues leading to suboptimal product quality at Cauchari-Olaroz; execution risk that would delay or result in lower than-expected production and/or cost overruns; lower-than-expected prices affecting economics adversely; macro slowdown resulting in reduced EV sales that could lower demand for lithium; and capital escalation and execution risks at the PPG project.

Upside risks include better-than-expected execution to produce battery-grade spec; favourable divesture or funding partnership with Ganfeng; better-than expected pricing; and higher-than-expected lithium price.

Financials & valuation: Lithium Argentina AG

Analyst Certification

The following analyst(s), economist(s), or strategist(s) who is(are) primarily responsible for this report, including any analyst(s) whose name(s) appear(s) as author of an individual section or sections of the report and any analyst(s) named as the covering analyst(s) of a subsidiary company in a sum-of-the-parts valuation certifies(y) that the opinion(s) on the subject security(ies) or issuer(s), any views or forecasts expressed in the section(s) of which such individual(s) is(are) named as author(s), and any other views or forecasts expressed herein, including any views expressed on the back page of the research report, accurately reflect their personal view(s) and that no part of their compensation was, is or will be directly or indirectly related to the specific recommendation(s) or views contained in this research report: Ishan Jain, Jonathan Brandt, CFA, Howard Lau, CFA, Shilan Modi, CFA, Sriharsha Pappu and Gustavo Hwang

Important disclosures

Equities: Stock ratings and basis for financial analysis

HSBC and its affiliates, including the issuer of this report ("HSBC") believes an investor's decision to buy or sell a stock should depend on individual circumstances such as the investor's existing holdings, risk tolerance and other considerations and that investors utilise various disciplines and investment horizons when making investment decisions. Ratings should not be used or relied on in isolation as investment advice. Different securities firms use a variety of ratings terms as well as different rating systems to describe their recommendations and therefore investors should carefully read the definitions of the ratings used in each research report. Further, investors should carefully read the entire research report and not infer its contents from the rating because research reports contain more complete information concerning the analysts' views and the basis for the rating.

From 23rd March 2015 HSBC has assigned ratings on the following basis:

The target price is based on the analyst's assessment of the stock's actual current value, although we expect it to take six to 12 months for the market price to reflect this. When the target price is more than 20% above the current share price, the stock will be classified as a Buy; when it is between 5% and 20% above the current share price, the stock may be classified as a Buy or a Hold; when it is between 5% below and 5% above the current share price, the stock will be classified as a Hold; when it is between 5% and 20% below the current share price, the stock may be classified as a Hold or a Reduce; and when it is more than 20% below the current share price, the stock will be classified as a Reduce.

Our ratings are re-calibrated against these bands at the time of any 'material change' (initiation or resumption of coverage, change in target price or estimates).

Upside/Downside is the percentage difference between the target price and the share price.

Prior to this date, HSBC's rating structure was applied on the following basis:

For each stock we set a required rate of return calculated from the cost of equity for that stock's domestic or, as appropriate, regional market established by our strategy team. The target price for a stock represented the value the analyst expected the stock to reach over our performance horizon. The performance horizon was 12 months. For a stock to be classified as Overweight, the potential return, which equals the percentage difference between the current share price and the target price, including the forecast dividend yield when indicated, had to exceed the required return by at least 5 percentage points over the succeeding 12 months (or 10 percentage points for a stock classified as Volatile*). For a stock to be classified as Underweight, the stock was expected to underperform its required return by at least 5 percentage points over the succeeding 12 months (or 10 percentage points for a stock classified as Volatile*). Stocks between these bands were classified as Neutral.

*A stock was classified as volatile if its historical volatility had exceeded 40%, if the stock had been listed for less than 12 months (unless it was in an industry or sector where volatility is low) or if the analyst expected significant volatility. However, stocks which we did not consider volatile may in fact also have behaved in such a way. Historical volatility was defined as the past month's average of the daily 365-day moving average volatilities. In order to avoid misleadingly frequent changes in rating, however, volatility had to move 2.5 percentage points past the 40% benchmark in either direction for a stock's status to change.

Rating distribution for long-term investment opportunities

As of 30 September 2025, the distribution of all independent ratings published by HSBC is as follows:

Buy	55%	(13% of these provided with Investment Banking Services in the past 12 months)
Hold	38%	(10% of these provided with Investment Banking Services in the past 12 months)
Sell	7%	(6% of these provided with Investment Banking Services in the past 12 months)

For the purposes of the distribution above the following mapping structure is used during the transition from the previous to current rating models: under our previous model, Overweight = Buy, Neutral = Hold and Underweight = Sell; under our current model Buy = Buy, Hold = Hold and Reduce = Sell. For rating definitions under both models, please see "Stock ratings and basis for financial analysis" above.

For the distribution of non-independent ratings published by HSBC, please see the disclosure page available at <http://www.hsbcnet.com/gbm/financial-regulation/investment-recommendations-disclosures>.
